                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Also described are methods for: (1) inhibiting an amyloid-beta peptide
(C (ABP) interaction with a receptor for RAGE when the receptor is on the
CC surface of a cell; (2) inhibiting degeneration of a neuronal cell; (3)
CC inhibiting formation of an ABP fibril on a cell; (4) inhibiting
CC extracellular assembly of an ABP into a fibril; (5) inhibiting
CC aggregation of ABP on the surface of a cell; (6) inhibiting infiltration
CC of a microglial cell into senile plaques; (7) inhibiting activation of a
CC microglial cell by an ABP; (8) treating a subject with a condition
CC associated with an interaction of an ABP with a receptor for RAGE on a
CC cell; (9) evaluating the ability of an agent to inhibit binding of an
CC ABP with a V-domain of a receptor for RAGE on the surface of a cell; (10)
CC ABP with a receptor for RAGE on the surface of a cell; (10)
CC with a receptor for RAGE when the receptor is on the surface of a cell;
CC with a receptor for RAGE when the receptor for RAGE on a cell with an interaction of an RAGE with a receptor for RAGE on a cell rhe methods
CC and be used for treating conditions associated with an interaction of an RAGE with a receptor for RAGE on a cell. The methods
CC ABP or an RAGE with a receptor for RAGE on a cell with an interaction of an RAGE with a receptor for RAGE on a cell with an interaction of an RAGE with a receptor for RAGE on a cell with an interaction of an CC ABP or an RAGE with a receptor for RAGE on a cell with an interaction of an CC ABP or an RAGE with a receptor for RAGE on a cell with an interaction of an CC ABP or an RAGE with a receptor for RAGE on a cell with an interaction of an CC ABP or an RAGE with a receptor for RAGE on a cell with an interaction of an CC ABP or an RAGE with a receptor for RAGE on a cell with an interaction of an CC ABP or an RAGE with a receptor for RAGE on a cell with an interaction of an CC ABP or an RAGE with a receptor for RAGE on a cell with an interaction of an CC ABP or an RAGE with a cell with an interaction of an RAGE with a cell w

                                                                                                                                                                                                     when considering tumour invasion. In normal developing neurons RAGE colocalizes with amphoterin which is a matrix associated polypeptide. The expression of both RAGE and amphoterin decreases after birth, but both have increased expression in tumours. RAGE polypeptides AAY52132-Y52135 are used in the invention in a method for inhibiting tumour invasion and metastasis. The method involves inhibiting tumour invasion and metastasis. The method involves inhibiting tumour invasion and metastasis via administration of a therapeutically effective amount of the pharmaceutical composition containing a RAGE polypeptide. The invention also relates to a method for evaluating the ability of an agent to inhibit tumour invasion in a local cellular environment. RAGE can be administered to a patient in a pharmaceutically acceptable
                                                                                                                                                                                                                                                                                                                                                                                                                                      This is the amino acid sequence of a fragment of the human soluble Receptor for Advanced Glycation Endproducts (RAGE). RAGE interacts was range of physiologically and pathophysiologically relevant ligands

```

The present sequence represents an immunologically active fragment of a soluble human receptor to an advanced glycosylation end product (RAGE) polypeptide. The present invention describes

Anti-advanced glycosylation end product polypeptide antibody prevents receptor binding and therefore reduces vascular permeability, useful to treat diabetes mellitus

Advanced glycosylation end products (AGE) of proteins are non-enzymatically glycosylated proteins, which accumulate in vascular tissue in ageing, and at an accelerated rate in individuals with diabetes. The Ab, which prevents the interaction between an AGE and it's receptor (RAGE), reduces vascular permeability. The Ab can be used to treat diabetes mellitus symptoms, e.g. microvasculopathy, occlusive vascular disorders, neuropathy, nephropathy, retinopathy, haemodialysis associated amyloidosis or atherosclerosis. The Ab can also be used for the isolation and purification of human RAGE polypeptide.
                          retinopathy) or haemodialysis-associated amyloidosis, also activation of microglial cells by beta-amyloid peptides in Alzheimer's disease or age-related disorders such as oxidative stress. These RAGE polypeptides are also used, when immobilised, to purify AGE from a protein mixture at to screen for compounds that are agonists and antagonists of AGE/RAGE
                                                                                                                                                                                                                  This is a peptide fragment of a human advanced glycosylation end-product receptor (RAGE) polypeptide. The RAGE polypeptides and its active fragments or their mimetics can inhibit interaction between advanced glycosylation end-products (AGE) and a receptor (specifically RAGE). They are used to treat diseases associated with AGE/RAGE interaction, such as increased vascular permeability, diabetes mellitus (particularly complications such as micro- or macro- vasculopathy or occlusive vascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New soluble advanced glycosylation end-product receptor polypeptide - used for reducing vascular permeability, complications of diabete etc., also for purification and to screen for modulators
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Advanced glycosylation vascular permeability;

                                    product (RAGE) polypeptide. The present invention describes an isolated antibody (Ab), specifically immunoreactive with RAGE. Advanced glycosylation end products (AGE) of proteins are non-enzymatically glycosylated proteins, which accumulate in vascular tissue in ageing, and at an accelerated rate in individuals with diabetes. The Ab, which prevents the interaction between an AGE and it's receptor (RAGE), reduces vascular permeability. The Ab can be used to treat diabetes mellitus symptoms, e.g. microvasculopathy, haemodialysis associated amyloidosis or atherosclerosis. The Ab can also be used for associated amyloidosis or atherosclerosis. The Ab can also be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         levels of AGE. Antibodies against RAGE polypeptides are useful as immunoassay reagents for measurement of RAGE levels, and as inhibitors of interaction between AGE and RAGE or other receptors and for purification and quantification of RAGE polypeptides. The encoding nucleic acids are used to express recombinant RAGE and as probes for isolating related
                                                                                                                                                                                                                                                            Anti-advanced glycosylation end product polypeptide antibody prevents receptor binding and therefore reduces vascular permeability, useful to treat diabetes mellitus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              genes

                                                                                                    This is a peptide fragment of a human advanced glycosylation end-product receptor (RAGE) polypeptide. The RAGE polypeptides and its active CC fragments or their mimetics can inhibit interaction between advanced CC glycosylation end-products (AGE) and a receptor (specifically RAGE). They CC are used to treat diseases associated with AGE/RAGE interaction, such as CC increased vascular permeability, diabetes mellitus (particularly CC complications such as micro- vasculopathy or occlusive vascular CC disorders such as micro- vasculopathy or occlusive vascular CC cretinopathy) or haemodialysis-associated amyloidosis, also activation CC of microgilal cells by beta-amyloid peptides in Alzaheimer's disease or age-related disorders such as oxidative stress. These RAGE polypeptides CC are also used, when immobilised, to purify AGE from a protein mixture and to screen for compounds that are agonists and antagonists of AGE/RAGE interaction. They can also be used diagnostically to detect abnormal CC levels of AGE. Antibodies against RAGE polypeptides are useful as CC interaction between AGE and RAGE or other receptors and for purification and quantification of RAGE polypeptides. The encoding nucleic acids are used to express recombinant RAGE and as probes for isolating related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ş

                                                                                                                                                                                                                                                                                                The present invention describes novel isolated peptides (I) having an CC amino acid sequence corresponding to an amino acid sequence of a CC v-domain of a receptor for an advanced glycation end product (RAGE). CC Also described are methods for: (1) inhibiting an amyloid-beta peptide CC (ABP) interaction with a receptor for RAGE when the receptor is on the CC surface of a cell; (2) inhibiting degeneration of a neuronal cell; (3) inhibiting formation of an ABP fibril on a cell; (4) inhibiting cell; (3) CC extracellular assembly of an ABP into a fibril; (5) inhibiting infiliration of aggregation of ABP on the surface of a cell; (6) inhibiting activation of a cegaration of a microglial cell into senile plaques; (7) inhibiting activation of a CC microglial cell by an ABP; (8) treating a subject with a condition cassociated with an interaction of an ABP with a receptor for RAGE on a cell; (9) evaluating the ability of an agent to inhibit binding of an CC cell; (9) evaluating the ability of an agent to inhibit binding of an CC ABP with a v-domain of a receptor for RAGE on the surface of a cell; (10) inhibiting activation of a subject; (12) inhibiting an RAGE's interaction cut in the surface of a cell; (11) inhibiting an each of a cell; (11) inhibiting an each of a cell; (12) inhibiting an RAGE's interaction cut in the surface of a cell; (13) treating a subject; (12) inhibiting an RAGE's interaction cut in the surface of a cell; (13) treating a subject; (14) inhibiting an RAGE's interaction cut in the surface of a cell; (12) treating a subject with a condition associated with an exceptor is on the surface of a cell; (13) treating a subject with a condition associated with an exceptor is on the surface of a cell; (13) treating an each of a cell; (14) treating an each of a cell; (15) the condition and cell; (16) the condition associated with an exceptor is on the surface of a cell; (17) treating and the cell into the cell into the surface of a cell; (18) the cell into the cell into the cell into the cell into the cell in
                                                                                                                                                                         and (13) treating a subject with a condition associated with an interaction of an RAGE with a receptor for RAGE on a cell. The methods can be used for treating conditions associated with an interaction of a ABP or an RAGE with a receptor for RAGE, e.g. diabetes, Alzheimer's disease, senility, renal failure, hyperlipidaemic atherosclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         multiple sclerosis; amyloidosis; autoimmune disease; inflammation; tumour; cancer; male impotence; wound healing; periodontal disease; neuropathy; retinopathy; nephropathy; neuronal degeneration.
                                                                                                   an autoimmune disease, inflammation, a tumour, cancer, male impotence,

                                                                                                                                                   This is the amino acid sequence of a fragment of the human soluble Receptor for Advanced Glycation Endoproducts (RAGE). RAGE interacts with a range of physiologically and pathophysiologically relevant ligands when considering tumour invasion. In normal developing neurons RAGE colocalizes with amphoterin which is a matrix associated polypeptide. The expression of both RAGE and amphoterin decreases after birth, but both have increased expression in tumours. RAGE polypeptides AAY52132-Y52135 are used in the invention in a method for inhibiting tumour invasion and metastasis. The method involves inhibiting tumour invasion and metastasis of the pharmaceutical composition containing a RAGE polypeptide. The invention also relates to a method for evaluating the ability of an agent to inhibit tumour invasion in a local cellular environment. RAGE can be administered to a patient in a pharmaceutically acceptable
                                                                                                                                                                                                                                                                                                                                                                                  Inhibiting tumour invasion or spreading by administration receptor for advanced glycation endproducts \boldsymbol{\cdot}

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a mature human receptor to an advanced glycosylation end product (RAGE) polypeptide. The present invention describes an isolated antibody (Ab), specifically immunoreactive with RAGE. Advanced glycosylation end products (AGE) of proteins are non-enzymatically glycosylated proteins, which accumulate in vascular tissue in ageing, and at an accelerated rate in individuals with diabetes. The Ab, which prevents the interaction between an AGE and it's receptor (RAGE), reduces vascular permeability. The Ab can be used to treat diabetes mellitus symptoms, e.g. microvasculopathy, haemodialysis associated amyloidosis or atheroscierosis. The Ab can also be used for the content of th

CC polypeptide (318 amino acid residues). The RAGE polypeptides and its

CC active fragments or their mimetics, inhibit interaction between advanced

CC glycosylation end-products (AGE) and a receptor (specifically RAGE). They

CC are used to treat diseases associated with AGE/RAGE interaction, such as

CC increased vascular permeability, diabetes mellitus (particularly

CC complications such as micro- or macro- vasculopathy or occlusive vascular

CC disorders such as neuropathy, nephropathy, retinopathy or

CC disorders such as neuropathy, nephropathy, retinopathy or

CC age-related disorders such as oxidative stress. These RAGE polypeptides

CC age-related disorders such as oxidative stress. These RAGE polypeptides

CC are also used, when immobilised, to purify AGE from a protein mixture and

CC to screen for compounds that are agonists and antagonists of AGE/RAGE

CC interaction. They can also be used diagnostically to detect abnormal

CC interaction between AGE and RAGE or other receptors and for purification

CC interaction between AGE and RAGE or other receptors and for purification

CC and quantification of RAGE polypeptides. The encoding nucleic acids are

CC used to express recombinant RAGE and as probes for isolating related

                                                                                                           This is the amino acid sequence of the human soluble Receptor for Advanced Glycation Endproducts (RAGE). RAGE interacts with a range of physiologically and pathophysiologically relevant ligands when considering tumour invasion. In normal developing neurons RAGE colocalizes with amphoterin which is a matrix associated polypeptide. The expression of both RAGE and amphoterin decreases after birth, but both have increased expression in tumours. RAGE polypeptides AAY52132-Y52135 are used in the invention in a method for inhibiting tumour invasion and metastasis. The method involves inhibiting tumour invasion and metastasis via administration of a therapeutically effective amount of the pharmaceutical composition containing a RAGE polypeptide. The invention also relates to a method for evaluating the ability of an agent to inhibit tumour invasion in a local cellular environment. RAGE can be administered to a patient in a pharmaceutically acceptable

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a soluble human receptor to an advanced glycosylation end product (RAGE) polypeptide. The present invention describes an isolated antibody (Ab), specifically immunoreactive with RAGE. Advanced glycosylation end products (AGE) of proteins are non-enzymatically glycosylated proteins, which accumulate in vascular tissue in ageing, and at an accelerated rate in individuals with diabetes. The Ab, which prevents the interaction between an AGE and it's receptor (RAGE), reduces vascular permeability. The Ab can be used to treat diabetes mellitus symptoms, e.g. microvasculopathy, neemodialysis associated amyloidosis or atheroselerosis. The Ab can also be used for the control of t
                New soluble advanced glycosylation end-product receptor polypeptide - used for reducing vascular permeability, complications of diabetes etc., also for purification and to screen for modulators
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Advanced glycosylation vascular permeability;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ρy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
                                                                                    Material for extracorporeal circulation, applicable in selective elimination of diabetic complication factors such as carbonyl stress products caused by abnormally promoted carbonyl stress from excretor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      to screen for compounds that are agonists and antagonists of AGE/RAGE interaction. They can also be used diagnostically to detect abnormal levels of AGE. Antibodies against RAGE polypeptides are useful as immunoassay reagents for measurement of RAGE levels, and as inhibitors of interaction between AGE and RAGE or other receptors and for purification and quantification of RAGE polypeptides. The encoding nucleic acids are used to express recombinant RAGE and as probes for isolating related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        glycosylation end-products (AGE) and a receptor (specifically RAGE). They are used to treat diseases associated with AGE/RAGE interaction, such as increased vascular permeability, diabetes mellitus (particularly complications such as micro- or macro- vasculopathy or occlusive vascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This is a human advanced glycosylation end-product receptor (RAGE) polypeptide (340 amino acid residues). The RAGE polypeptides and its active fragments or their minetics, inhibit interaction between advanced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                age-related disorders such as oxidative stress. These RAGE polypeptides are also used, when immobilised, to purify AGE from a protein mixture are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              atherosclerosis) or haemodialysis-associated amyloidosis, also activation of microglial cells by beta-amyloid peptides in Alzheimer's disease or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ş
The present invention describes novel isolated peptides (I) having an cannot acid sequence corresponding to an amino acid sequence of a CV domain of a receptor for an advanced glycation end product (RAGE).

Also described are methods for: (1) inhibiting an amyloid-beta peptide (RABP) interaction with a receptor for RAGE when the receptor is on the surface of a cell; (2) inhibiting degeneration of a neuronal cell; (3) inhibiting formation of an ABP fibril on a cell; (4) inhibiting cell; (3) continuity of an ABP into a fibril; (5) inhibiting infiltration aggregation of ABP on the surface of a cell; (6) inhibiting infiltration of a microglial cell into senile plaques; (7) inhibiting activation of a massociated with an interaction of an ABP with a receptor for RAGE on a cell; (9) evaluating the ability of an agent to inhibit binding of an ABP with a V-domain of a receptor for RAGE on the surface of a cell; (10) inhibiting activation of a NF-kappaB gene in a cell; (11) inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 having the sequence shown here. The materials of the invention, including ladsorbents, are for extracorporeal circulation, which are applicable in the selective elimination of diabetic complication factors from a body fluid, and are therefore useful in treating vascular lesions like arteriosclerosis due to carbonyl stress products caused by abnormally promoted carbonyl stress from excretory dysfunction.
                                                                                                                                                                                                                                                                            Claim 3; Page 78; 101pp; English.
                                                                                                                                                                                                                                                                                                              New peptides based on an advanced glycation end product receptor useful for treating Alzheimer's disease and Down's syndrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       neuronal cytotoxicity; head trauma; amyotrophic lateral sclerosis; multiple sclerosis; amyloidosis; aucoimmune disease; inflammation; tumour; cancer; male impotence; wound healing; periodontal disease; neuropathy; retinopathy; nephropathy; neuronal degeneration.

C:Comment: Advanced glycosylation end products are heterogeneous nonenzymatically gly cellular function, thus contributing to tissue lesions in diabetes.
C:Comment: This receptor appears also to mediate the effects of amyloid beta peptide ates in the neurotoxic pathway that produces dementia in Alzheimer's disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     advanced glycosylation end-products receptor precursor - bovine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A; Gene: RAGE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A; Molecule type: DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A; Status: preliminary; translated
                             Note: sequence extracted from NCBI backbone (NCBIP:109434); Comment: Advanced glycosylation end products are heterogeneous nonenzymatically glycosyllular function, thus contributing to tissue lesions in diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matiches

Submitted to the EMBL Data Library, April 1998

A:Description: cDNA encoding a pea SAR DNA-binding protein that shows homology to nucleo A;Reference number: Z15637

A;Reference T06377

A;Accession: T06377

A;Status: preliminary; translated from GB/EMBL/DDBJ

A;Molecule type: mRNA

A;Residues: 1-560 <HATD

-i- FUNCTION: 2-HYDROXYMUCONIC ACID SEMIALDEHYDE CAN BE CONVERTED TO 2-HYDROXYPENT-2,4-DIENOAM'E EITHER DIRECTLY BY THE ACTION OF 2-HYDROXYMUCONIC SEMIALDEHYDE HYDROLASE (HMSH) OR BY THE ACTION OF THEEE SEQUENTIAL ENZYMES, THE FIRST OF WHICH IS HMSD. CAN OXIDIZ NOT ONLY 2-HYDROXYMUCONIC SEMIALDEHYDE AND ITS ANALOGS. OPTIMAL PH OF CATALYSIS FOR THE DENZALDEHYDE AND ITS ANALOGS. OPTIMAL PH OF CATALYSIS FOR THE OXIDATION OF 2-HYDROXYMUCONIC SEMIALDEHYDE AND BENZALDEHYDE ARE RESPECTIVELY 8.3 AND 9.6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inoue J., Shaw J.P., Rekik M., Harayama S.;
